Award Winning Dentistry

Awarded No1 clinic in Romania (April 2017) and top 1% of 130k dental clinics worldwide by Global Clinic Rating.

UK Trained Dentists

Dr Cosmin Teasdale, Principal Dentist, has over 10 years UK experience and is post-graduate trained at Chester University. A member of the British Society of Endodontics and the Academy of Microscopic Enhanced Dentistry, his main areas of expertise are CAD-CAM and Microscopic dentistry, root canal treatment, implantology, cosmetic, restorative and preventive dentistry, together with treatment of periodontal disease.

Dr Ninian Peckitt, originally from the UK is our Medical Director and Clinical Trainer and has over 40 years experience. He has Fellowships in General Surgery, Oral and Maxillofacial Surgery and Cosmetic Surgery. Widely published, he was the first to introduce CAD/CAM to surgery and has an international reputation in reconstructive surgery and Engineering Assisted Surgery™.

Microscopic Dentistry

With the aid of a microscope, dental procedures can be done with greater accuracy. It can be used in most dental procedures such as cavity treatments or prosthetics, but is especially used in root canal treatments, the advantage being the preciseness in treatment. Thus possible after-effects are eliminated, which ensures the durability of treatment in time.

Same Day Crowns & Veneers

Using the latest CEREC 3D Printed Technology a single crown or veneer can be milled in-house within 8 minutes, meaning you can have your new restoration custom made and fitted within the hour.

Digital Smile Design

Using state of the art technology to create advanced three-dimensional mock-ups with computer images, our highly skilled cosmetic dentist works with care and precision to create your personalised smile.

Oral Cancer Screening

The Revolutionary Velscope helps visualise oral mucosal abnormalities, including oral cancer, that may not be apparent or even visible with the naked eye. This procedure is part of our consultation and is standard practice for every patient.

Diagnodent Cavity Detecting Device

A high tech laser fluorescence caries detection aid which measures changes in tooth structure caused by caries (cavities). It is especially useful for pit and fissure areas - even when the outer tooth structure seems to be intact. This device is over 90% accurate in detecting early cavities. The Diagnodent is simply unique and no other procedure, whether visual, or x-ray based, achieves comparable results.

Use of Surgical Guides in Implant Placement

All implants are placed using custom made surgical guides in order to eliminate surgical errors. The benefits of a surgical guide are

many, including shorter surgery time, a more precise, safe and predictable flapless surgery and shorter recovery time. In many cases the need for bone grafting can be eliminated and immediate loading is possible.

Use of Proven Implant Systems

When it comes to implants, one size does not fit all. We follow complex treatment planning protocols to address the pandemic of peri implantitis currently estimated at 40% - 80% of Global Implants placed. We are yet to observe a case of peri implantitis with our chosen implant systems and continue to audit our cases.

Protocols of Best Practice & Clinical Audit

We continually invest in state of the art technology, materials, training and our comprehensive clinical team. We run postgraduate international training courses for the benefit of clinicians and their patients and advocate patient safety through the implementation of Protocols of Best Practice and Clinical Audit.
